

EN series BB 3... DN 50-125, DN 450/500
ASME series BB 3... NPS 2"-5", NPS 18"/20"

EN series BB 3... DN 150-400,
face to face dimension as per EN 558

ASME series BB 3... NPS 6" – 16",
face to face dimension as per API 594

Dual-Plate Check Valve

BB 3...C steel, **BB 3...A** stainless steel

EN series: PN 10/16/25/40, DN 50 - 500

ASME series: Class 150/300, NPS 2" - 20"

Description

Dual-plate check valves prevent return flow in horizontal and vertical pipelines. They are wafer-type valves of double swing design.

For installation in horizontal pipelines, they are fitted with closing springs. For installation in vertical pipes with upward flow, closing springs may be included if required. For installation in vertical pipes with downward flow, they require 5V0 closing springs.

Dual-plate check valves can be used for liquids, gases and vapours in accordance with the Pressure Equipment Directive.

Versions

The EN series complies with European requirements and the ASME series complies with American requirements.

BB 3... is available made of steel (BB 3...C) or stainless steel (BB 3...A).

The swing disc's standard seat gaskets are metal-to-metal seals.

Optional features

- The ASME series BB 3...ASME (NPS 6" – 20") is optionally available with face to face dimension according to EN 558. Replaces BB 1...ASME and BB 2...ASME.
- Depending on the temperature limits and chemical resistance, seat gaskets such as EPDM, FPM (FKM), NBR or PTFE are available
- The stainless steel closing springs can be chosen according to installation position
- Closing springs optionally available made of Inconel (7WA)
- For systems that may experience pressure surges, dampers are available

Material specifications

The equipment designations include material specifications:

BB ...C: Steel

BB ...A: Stainless steel

Pressure loss diagram

Values for water at 20°C. To determine pressure loss for other fluids, calculate equivalent water volume flow \dot{V}_w .

Pressure loss rates in the diagram apply to equipment with standard 7-mbar spring used in horizontal pipelines and to equipment with special-issue 2-mbar spring used in horizontal pipelines.

$$\dot{V}_w = \dot{V} \cdot \sqrt{\frac{\rho}{1000}}$$

\dot{V}_w = Equivalent water volume flow in [l/s] or [m³/h]

ρ = Density of fluid (under operation) in [kg/m³]

\dot{V} = Volume of fluid (under operation) in [l/s] or [m³/h]

● Required minimum volume flow \dot{V}_w for equipment with special-issue spring 2WA used in horizontal pipes.

● Required minimum volume flow \dot{V}_w for equipment with standard spring 7WA used in horizontal pipes.

Minimum volume flow [m³/h]

Direction of flow	↑	→		→	
Spring type	w/o spring	7 WA		2 WA	
DN	Valve completely open	stable partly open*)	Valve completely open	stable partly open*)	Valve completely open
50	12	4	9	3	7

Dual-Plate Check Valve

BB 3...C steel, **BB 3...A** stainless steel

EN series:

PN 10/16/25/40, DN 50 – 500

ASME series:

Class 150/300, NPS 2" – 20"

Specification text

GESTRA DISCOCHECK® Dual-Plate Check Valves

BB 3... Wafer-type valve EN series short overall length as per EN 558 series 16 or ASME series as per API standard 594 (ASME series optionally available compliant with EN 558). Two independently moving swing discs and four closing springs.

Type:

Material:

Nominal size DN/NPS:

Pressure rating PN/Class:

Direction of flow:

Seat gasket:

Closing spring:

Systems with heavily pulsating flow, e.g. systems with compressors, may require special-issue dual-plate check valves.

When ordering, please always specify such special circumstances and provide all operating data as precisely as possible.

Inspection and Certification

Verification of material and construction testing in the form of manufacturer certificates in accordance with EN 10204-2.2 or acceptance test certificate EN 10204-3.1 available.

Please specify your acceptance requirements in your enquiry or order. Test certificates can no longer be issued after delivery.

For standard testing scope and costs of test certificates, please refer to our price list "Test and Inspection Charges for Standard Equipment".

If you require amended test scopes, please contact the manufacturer.

Application of European Directives

Pressure Equipment Directive

The equipment conforms to this directive and can be used for the following fluids: BB ... A and BB ... C:

■ Fluid group 1

■ Fluid group 2

ATEX Directive

The equipment does not have its own potential ignition source and is therefore not subject to this directive.

Once installed, static electricity may arise between the equipment and the connected system.

When used in potentially explosive atmospheres, the plant manufacturer or plant operator is responsible for discharging or preventing possible static charge.

If it is possible for medium to escape, e.g. through actuating mechanisms or leaks in threaded joints, the plant manufacturer or plant operator must take this into consideration when dividing the area into zones.

Please note our terms of sale and delivery.

Equipment with dampers

The optional dampers may affect the closing characteristics. A damper fluid slows the swing motion through the last 15° of the closing path. This reduces the swing discs' closing rate and prevents water hammers in the pipe from causing problems.

The damper cylinders are maintenance-free.
